

JENKINS JVM 21 Fix - LIL LEAP

In some cases Jenkins is not using the VM as defined by JAVA_HOME set on the linux virtual. In these cases we have to tell Jenkins directly where to go to get the proper JVM version.

1. Bring up jenkins in your windows virtual and go to Settings-> Tools

Add the proper JDK to the Jenkins toolset:

Set JAVA_HOME to /usr/lib/jvm/java-21-amazon-corretto.x86_64

2. Pull down your latest jenkins file and ensure it has JDK21 listed under tools:

```
pipeline {
  agent any
  tools {
    jdk 'JDK21'
  }
  stages {
    stage('Checkout') {
      steps {
        checkout scm
      }
    }
    stage('Build Image') {
      steps {
        sh 'mvn -B clean package -DskipTests'
        sh 'docker build -t sprint1-greeter-app:latest .'
      }
    }
    stage('Smoke Test') {
      steps {
        sh 'docker run sprint1-greeter-app:latest'
      }
    }
  }
}
```

If it does not, go a 'git pull' on your repository.

3. Fix the package class for your Main.java as it does not have the package referred to in your maven file.
4. Remove the Thread.sleep in your Main.java as this will not allow Jenkins pipeline to finish.
